Building sales performance dashboards

Github Link: https://github.com/priyanshnolkha/Data-Analytics-For-Business-Projects/main/Experiment_5_Walmart_dashboard <https://github.com/Priyanshnolkha/Data-Analytics-For-Business-Projects/tree/main/Experiment%205%20Walmart%20Dashboard>

Problem Statement :

You are a Sales Analyst for a retail chain. The sales director wants to monitor revenue, profit, product performance, and regional sales through a single dashboard. Design an interactive sales dashboard that supports data-driven decision-making.

Methodology :

Data Visualization (Creating Dashboard With Changing Values):

In my dashboard first I have arranged all KPI cards, charts, tables, and slicers into a single interactive dashboard.

The dashboard includes:

- Total Sales KPI
- Total Profit KPI
- Total Quantity KPI
- Profit by Category
- Product-wise Sales Table
- Profit by Year
- Sales by Category • Sales by Year

- Interactive Slicers

In the dashboard it enables users to analyze sales performance efficiently and supports data-driven business decisions.

Dashboard Images :

1st Image:

- It displays the overall sales performance of Walmart from 2011–2014 without any filters.
- It Shows Total Sales (725.44K), Total Profit (108.41K), and Total Quantity (12K) along with category-wise and yearly analysis.
- It provides a complete overview of business performance using interactive charts and slicers.

2nd Image:

In dashboard after selecting the cluster column chart

- After selecting a bar in the Profit by Category (Column Chart), all visuals are filtered to display data for the selected product category only.
- The KPI cards are updated to Total Sales = 98.68K, Total Profit = 9.11K, and Total Quantity = 1K, while the table and other charts show data related to the selected category.
- This interaction helps analyze the sales and profit performance of a specific product category.

3rd Image:

In dashboard after selecting the Pie chart

- After selecting a slice in the Sales by Year (Pie Chart), all visuals are filtered to display data for the selected year only.
- The KPI cards change to Total Sales = 250.63K, Total Profit = 43.90K, and Total Quantity = 4K, and all charts update to show the performance for that selected year.

- This helps compare yearly sales performance and understand how each year contributed to the overall business growth.

Business Insights:

- The dashboard shows overall business performance with 725.44K Total Sales, 108.41K Total Profit, and 12K Total Quantity Sold.
- Copiers generated the highest profit, while Chairs recorded the highest sales, making them the best-performing product categories.
- Sales and profit are distributed across 2011–2014, helping identify yearly business performance and growth trends.
- Slicers (Category, State, City, Year, Month, and Day) enable users to filter the dashboard and analyze business performance from different perspectives, supporting data-driven decision-making.

Conclusion:

The Walmart Sales dataset was successfully imported into Microsoft Power BI and transformed into an interactive sales performance dashboard using KPI cards, bar charts, column charts, pie charts, donut charts, tables, and slicers. The dashboard effectively analyzed sales, profit, quantity, product performance, and yearly trends, providing clear business insights. Overall, the interactive dashboard supports datadriven decision-making by enabling users to monitor and evaluate sales performance efficiently.
